High Frequency Charge Amplifier

Operation

The amplifier is AC coupled for direct use with a charge sensor producing sinusoidal signals with no DC background. A source capacitance of less than 1 nF is recommended for proper operation. If the effective source capacitance (sensor plus cable capacitance) is small relative to the effective input impedance of the amplifier (10 nF) the amplifier acts as a virtual ground and most of the charge flows into the amplifier input.
 At 1 MHz the amplifier input capacitance of 10 nF corresponds to a complex input impedance of 20Ω . An input resistor of $1 \text{ G}\Omega$ is incorporated to prevent buildup of static charge. The amplifier is not suited for sources producing an average DC background current as this would saturate the device.
